## MODEL-BASED ANALYSIS OF WIRELESS SYSTEM ARCHITECTURES FOR REAL-TIME APPLICATIONS

### ABSTRACT:

We propose a model-based description and analysis framework for the design of wireless system architectures. Its aim is to address the shortcomings of existing approaches to system verification and the tracking of anomalies in safety-critical wireless systems. We use Architecture Analysis and Description Language (AADL) to describe an analysis-oriented architecture model with highly modular components.

We develop the cooperative tool chains required to analyze the performance of a wireless system by simulation. We show how this framework can support a detailed and largely automated analysis of a complicated, networked wireless system using examples from wireless healthcare and video broadcasting.

We proposed a model-based description and analysis framework for the design of wireless system architectures. Using AADL, the de facto standard formal architecture description language, we have demonstrated how a high level of modularity can be achieved in simulated wireless network systems. We showed that our framework can support detailed and largely automated analysis of complicated networked wireless systems.

**Internet of Everything** Beniamino Di Martino,Kuan-Ching Li,Laurence T. Yang,Antonio Esposito,2017-10-15 This book focuses on the Internet of Everything and related fields The Internet of Everything adds connectivity and intelligence to just about every device giving it special functions The book provides a common platform for integrating information from heterogeneous sources However this can be quite reductive as the Internet of Everything provides links not only among things but also data people and business processes The evolution of current sensor and device networks with strong interactions between people and social environments will have a dramatic impact on everything from city planning first responders the military and health Such a shared ecosystem will allow for the interaction between data sensor inputs and heterogeneous systems Semantics is a fundamental component of this since semantic technologies are able to provide the necessary bridge between different data representations and to solve terminology incongruence Integrating data from distributed devices sensor networks social networks and biomedical instruments requires first of all the systematization of the current state of the art in such fields Then it is necessary to identify a common action thread to actually merge and homogenize standards and techniques applied in such a heterogeneous field The exact requirements of an Internet of Everything environment need to be precisely identified and formally expressed and finally the role of modern computing paradigms such as Cloud and Fog Computing needs to be assessed with respect to the requirements expressed by an Internet of Everything ecosystem
