Iteration Of Rational Functions X Analyt:

Fundamentals of the Analytical Mechanics of Shells Nikolai Aleksandrovich Kil'chevskii, 1965 Noniterative
Coordination in Multilevel Systems Todor Stoilov, 2012-12-06 Multilevel decision theory arises to resolve the contradiction between increasing requirements towards the process of design synthesis control and management of complex systems and the limitation of the power of technical control computer and other executive devices which have to perform actions and to satisfy requirements in real time This theory rises suggestions how to replace the centralised management of the system by hierarchical coordination of sub processes All sub processes have lower dimensions which support easier management and decision making But the sub processes are interconnected and they influence each other Multilevel systems theory supports two main methodological tools decomposition and coordination Both have been developed and implemented in practical applications concerning design control and management of complex systems In general it is always beneficial to find the best or optimal solution in processes of system design control and management The real tendency towards the best optimal decision requires to present all activities in the form of a definition and then the solution of an appropriate optimization problem Every optimization process needs the mathematical definition and solution of a well stated optimization problem These problems belong to two classes static optimization and dynamic optimization Static optimization problems are solved applying methods of mathematical programming conditional and unconditional optimization Dynamic optimization problems are solved by methods of variation calculus Euler Lagrange method maximum principle dynamical programming

Proceedings of the IEEE Workshop on Nonlinear Dynamics of Electronic Systems Gianluca Setti, Riccardo Rovatti, Gianluca Mazzini, 2000 This volume collects together state of the art contributions to the IEEE workshop on Nonlinear Dynamics of Electronic Systems *Antennas* Boris Levin, 2024-12-26 This book describes both known and new results In the sections devoted to the use of integral equations for the current in a linear metal radiator the focus is on Leontovich's equation An advantage of this equation is the simplicity of the solution and the absence of the argument in it because the integration over already performed The refined solution makes it possible to determine the total sum of the series for the current which is close to the known solution including only the first terms The results of the synthesis of different types of antennas with capacitive loads are presented which makes it possible to implement Hallen's hypothesis about the usefulness of applying such loads to create an in phase current distribution in antennas and to obtain required characteristics New results include the widespread use of the complex potential method in relation to the calculation of capacitive structures in homogeneous and inhomogeneous media antenna patterns and flows of electrical fields between antenna elements and in the surrounding space In particular the analysis of field flows makes it possible to substantiate a rigorous method for analyzing microstrip antennas The characteristics of antennas in various conditions of their installation are considered and compared The results of the use of multi floors structures that provide in the wide frequency range the

radiation in direction perpendicular to the antenna axis and structures that make it possible to reduce the mutual influence of antennas located at different heights on a common mast are described

Complex Analysis with MATHEMATICA® William T. Shaw, 2006-04-20 This book presents a way of learning complex analysis using Mathematica Includes CD with electronic version of the book

Optimal Auxiliary Functions Method for Nonlinear Dynamical Systems Vasile Marinca, Nicolae Herisanu, Bogdan Marinca, 2021-07-14 This book presents the optimal auxiliary functions method and applies it to various engineering problems and in particular in boundary layer problems The cornerstone of the presented procedure is the concept of optimal auxiliary functions which are needed to obtain accurate results in an efficient way Unlike other known analytic approaches this procedure provides us with a simple but rigorous way to control and adjust the convergence of the solutions of nonlinear dynamical systems The optimal auxiliary functions are depending on some convergence control parameters whose optimal values are rigorously determined from mathematical point of view The capital strength of our procedure is its fast convergence since after only one iteration we obtain very accurate analytical solutions which are very easy to be verified Moreover no simplifying hypothesis or assumptions are made The book contains a large amount of practical models from various fields of engineering such as classical and fluid mechanics thermodynamics nonlinear oscillations electrical machines and many more The book is a continuation of our previous books Nonlinear Dynamical Systems in Engineering Some Approximate Approaches Springer 2011 and The Optimal Homotopy Asymptotic Method Engineering Applications Springer 2015
