The Design of Approximation Algorithms David P. Williamson, David B. Shmoys, 2011-04-26 Discrete optimization problems are everywhere from traditional operations research planning scheduling facility location and network design to computer science databases to advertising issues in viral marketing Yet most such problems are NP hard unless P = NP there are no efficient algorithms to find optimal solutions This book shows how to design approximation algorithms efficient algorithms that find provably near optimal solutions The book is organized around central algorithmic techniques for designing approximation algorithms including greedy and local search algorithms dynamic programming linear and semidefinite programming and randomization Each chapter in the first section is devoted to a single algorithmic technique applied to several different problems with more sophisticated treatment in the second section The book also covers methods for proving that optimization problems are hard to approximate Designed as a textbook for graduate level algorithm courses it will also serve as a reference for researchers interested in the heuristic solution of discrete optimization problems

Algorithmics for Hard Problems Juraj Hromkovič, 2013-03-14 Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general textbooks on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to close this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound results new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners

Approximation Algorithms for NP-hard Clustering Problems Ramgopal Reddy Mettu, 2002 Given a set of n points and their pairwise distances the goal of clustering is to partition the points into a small number of related sets Clustering algorithms are used widely to manage classify and summarize many kinds of data In this dissertation we study the classic facility location and k median problems in the context of clustering and formulate and study a new optimization problem that we call the online median problem For each of these problems it is known to be NP hard to compute a solution with cost less than a certain constant factor times the optimal cost We give

simple constant factor approximation algorithms for the facility location k median and online median problems with optimal or near optimal time bounds We also study distance functions that are approximately metric and show that such distance functions allow us to obtain a faster online median algorithm and to generalize our analysis to other objective functions such as that of the well known k means heuristic Given n points the associated interpoint distances and nonnegative point weights and a nonnegative penalty for each point the facility location problem asks us to identify a set of cluster centers so that the weighted average cluster radii and the sum of the cluster center penalties are both minimized The k median problem asks us to identify exactly k cluster centers while minimizing just the weighted average cluster radii We give a simple greedy algorithm for the facility location problem that runs in $O(n^2)$ time and produces a solution with cost at most 3 times optimal For the k median problem we develop and make use of a sampling technique that we call successive sampling and give a randomized constant factor approximation algorithm that runs in $O(nk \log n \log^2 n)$ time We also give an $\Omega(nk)$ lower bound on the running time of any randomized constant factor approximation algorithm for the k median problem that succeeds with even a negligible constant probability In many settings it is desirable to browse a given data set at differing levels of granularity i e number of clusters To address this concern we formulate a generalization of the k median problem that we call the online median problem The online median problem asks us to compute an ordering of the points so that over all i when a prefix of length i is taken as a set of cluster centers the weighted average radii of the induced clusters is minimized We show that a natural generalization of the greedy strategy that we call hierarchically greedy yields an algorithm that produces an ordering such that every prefix of the ordering is within a constant factor of the associated optimal cost Furthermore our algorithm has a running time of $\Theta(n^2)$ Finally we study the performance of our algorithms in practice We present implementations of our k median and online median algorithms our experimental results indicate that our approximation algorithms may be useful in practice
