

Membrane Structure

What molecules make up a membrane?

Directions: Remember to answer the following questions using a *different color font*.

Why?

Imagine your bedroom without closets, drawers, shelves, bags or boxes—just a room with a bed. Where would your stuff be? Would you be able to find the things you needed? How efficiently could you get ready for school in the morning? Would all of your school items be together when you sat down to study? The compartments you use in your room—the closet, drawers, etc.—help you organize items by category so that all the items you need to get dressed are in one place. All the items you need for studying are in another place. This compartmentalization improves efficiency. Cells also need organization to improve efficiency. The compartmentalization of cells is achieved by dividing up areas in the cell with membranes. A plasma membrane compartmentalizes internal structures while the cell membrane acts as a boundary between the cell and the external environment.

Molecular Biology of Membranes H.R. Petty, 2013-06-29 This text attempts to introduce the molecular biology of cell membranes to students and professionals of diverse backgrounds Although several membrane biology books are available they do not integrate recent knowledge gained using modern molecular tools with more traditional membrane topics Molecular techniques such as cDNA cloning and x ray diffraction have provided fresh insights into cell membrane structure and function The great excitement today which I attempt to convey in this book is that molecular details are beginning to merge with physiological responses In other words we are beginning to understand precisely how membranes work This textbook is appropriate for upper level undergraduate or beginning graduate students Readers should have previous or concurrent coursework in biochemistry prior studies in elementary physiology would be helpful I have found that the presentation of topics in this book is appropriate for students of biology biochemistry biophysics and physiology chemistry and medicine This book will be useful in courses focusing on membranes and as a supplementary text in biochemistry courses Professionals will also find this to be a useful resource book for their personal libraries

The Enzymes of Biological Membranes A.N. Martonosi,2012-12-06 In the first edition of The Enzymes of Biological Membranes published in four volumes in 1976 we

collected the mass of widely scattered information on membrane linked enzymes and metabolic processes up to about 1975. This was a period of transition from the romantic phase of membrane biochemistry preoccupied with conceptual developments and the general properties of membranes to an era of mounting interest in the specific properties of membrane linked enzymes analyzed from the viewpoints of modern enzymology. The level of sophistication in various areas of membrane research varied widely: the structures of cytochrome c and cytochrome b5 were known to atomic detail while the majority of membrane linked enzymes had not even been isolated. In the intervening eight years our knowledge of membrane linked enzymes expanded beyond the wildest expectations. The purpose of the second edition of *The Enzymes of Biological Membranes* is to record these developments. The first volume describes the physical and chemical techniques used in the analysis of the structure and dynamics of biological membranes. In the second volume the enzymes and metabolic systems that participate in the biosynthesis of cell and membrane components are discussed. The third and fourth volumes review recent developments in active transport, oxidative phosphorylation and photosynthesis.

The study of membranes has become of high importance in the fields of biology, pharmaceutical chemistry and medicine since much of what happens in a cell or in a virus involves biological membranes. The current book is an excellent introduction to the area which explains how modern analytical methods can be applied to study biological membranes and membrane proteins and the bioprocesses they are involved to.

Biological Membranes: Structure, Biogenesis and Dynamics Jos A.F. Op den Kamp, 2013-06-29

The Advanced Study Institute on Structure Biogenesis and Dynamics of Biological Membranes held in Cargèse from June 14-26 1993 has been dealing with four major topics in membrane biochemistry today: lipid dynamics and lipid-protein interactions, protein translocation and insertion, intracellular traffic and protein structure and folding. The lecturers discussed these topics starting from several disciplines including biochemistry, cell biology, genetics and biophysics. This way an interdisciplinary and very interesting view on biological membrane systems was obtained. At first an extensive overview of mainly biophysical techniques which can be used to study dynamic processes in membranes was presented. Sophisticated approaches such as ESR and NMR have been applied successfully to unravel details of specific lipid-protein interactions. X-ray analysis provides detailed structural information of several proteins and the possible implications for protein functions. Information obtained this way is complemented by studies on mechanisms and kinetics of protein folding. The latter information is indispensable when discussing protein translocation and insertion processes in which folding and unfolding play essential roles. Extensive insight was offered in the complicated machinery of phospholipid biosynthesis. In particular the application of sophisticated genetic techniques has allowed a better understanding of the mechanisms regulating the synthetic machinery and detailed studies on a variety of mutants lacking
