

PHYSICS GRADE 10

CHAPTER ONE LINEAR MOTION

Introduction

Study of motion is divided into two;

1. Kinematics
2. Dynamics

In kinematics forces causing motion are disregarded while dynamics deals with motion of objects and the forces causing them.

1. Displacement

Distance moved by a body in a specified direction is called displacement. It is denoted by letter 's' and has both magnitude and direction. Distance is the movement from one point to another. The SI unit for displacement is the metre (m).

2. Speed

This is the distance covered per unit time.

Speed = distance covered / time taken. Distance is a scalar quantity since it has magnitude only. The SI unit for speed is metres per second (m/s or ms⁻¹)

Average speed = total distance covered / total time taken

Other units for speed used are Km/h.

Examples

1. A body covers a distance of 10m in 4 seconds. It rests for 10 seconds and finally covers a distance of 90m in 60 seconds. Calculate the average speed.

Solution

$$\text{Total distance covered} = 10 + 90 = 100 \text{ m}$$

$$\text{Total time taken} = 4 + 10 + 60 = 70 \text{ seconds}$$

$$\text{Therefore average speed} = 100 / 70 = 5 \text{ m/s}$$

2. Calculate the distance in metres covered by a body moving with a uniform speed of 180 km/h in 30 seconds.

Solution

$$\text{Distance covered} = \text{speed} \times \text{time}$$

$$= 180 \times 1000 / 60 \times 60 = 5 \text{ m/s}$$

$$= 50 \times 30$$

$$= 1,500 \text{ m}$$

3. Calculate the time in seconds taken by a body moving with a uniform speed of 360 km/h to cover a distance of 3,000 km?

Solution

$$\text{Speed: } 360 \text{ km/h} = 360 \times 1000 / 60 \times 60 = 100 \text{ m/s}$$

$$\text{Time} = \text{distance} / \text{speed}$$

$$3000 \times 1000 / 100$$

$$= 30,000 \text{ seconds.}$$

3. Velocity

This is the change of displacement per unit time. It is a vector quantity.

Velocity = change in displacement / total time taken

The SI units for velocity are m/s

2013 September Exam Grade10 Physical Science

Iver P. Cooper

2013 September Exam Grade10 Physical Science:

But Will It Fly? Iver P. Cooper, 2025-09-17 Conventional aircraft today are propelled by the action of propellers or jets and powered by the internal combustion of petroleum fuels in piston turboprop or jet engines. But other power sources powerplants and propulsion devices for airships as well as aircraft have been proposed and even experimented with over the last few centuries. The power sources considered include human muscles, steam batteries, nuclear reactors and hydrogen fuel and the propulsion devices include sails, oars, flapping wings, rockets and cycloidal propellers. This meticulously researched book presents the history of these unconventional aerial power and propulsion systems, explains the underlying science and technology behind them and assesses the crucial question of practicality.

Developing Synesthesia Nicolas Rothen, Julia Simner, Beat Meier, 2015-07-24 Synesthesia is a condition in which a stimulus elicits an additional subjective experience. For example, the letter 'E' printed in black, the inducer, may trigger an additional colour experience as a concurrent, e.g. blue. Synesthesia tends to run in families and thus a genetic component is likely. However, given that the stimuli that typically induce synesthesia are cultural artefacts, a learning component must also be involved. Moreover, there is evidence that synesthetic experiences not only activate brain areas typically involved in processing sensory input of the concurrent modality; synesthesia seems to cause a structural reorganisation of the brain. Attempts to train non-synesthetes with synesthetic associations have been successful in mimicking certain behavioural aspects and posthypnotic induction of synesthetic experiences in non-synesthetes has even led to the according phenomenological reports. These latter findings suggest that structural brain reorganization may not be a critical precondition but rather a consequence of the sustained coupling of inducers and concurrents. Interestingly, synesthetes seem to be able to easily transfer synesthetic experiences to novel stimuli. Beyond this, certain drugs, e.g. LSD, can lead to synesthesia-like experiences and may provide additional insights into the neurobiological basis of the condition. Furthermore, brain damage can both lead to a sudden presence of synesthetic experiences in previously non-synesthetic individuals and a sudden absence of synesthesia in previously synesthetic individuals. Moreover, enduring sensory substitution has been effective in inducing a kind of acquired synesthesia. Besides informing us about the cognitive mechanisms of synesthesia, synesthesia research is relevant for more general questions, for example, about consciousness such as the binding problem, about crossmodal correspondences and about how individual differences in perceiving and experiencing the world develop. Hence, the aim of the current Research Topic is to provide novel insights into the development of synesthesia, both in its genuine and acquired form. We welcome novel experimental work and theoretical contributions, e.g. review and opinion articles focussing on factors such as brain maturation, learning, training, hypnosis, drugs, sensory substitution and brain damage and their relation to the development of any form of synesthesia.
