2014 97ms As Levels:

Brain Development and the Attention Spectrum Itai Berger, Anna Remington, Yael Leitner, Alan Leviton, 2015-06-16 Early onset and enduring developmental deficits in attention especially if combined with increased hyperactivity and impulsivity may result in constant impairments in multiple domains of personal life. The full spectrum of symptoms is characterized by a persistent pattern of inattention and/or hyperactivity/impulsivity which is maladaptive and inconsistent with a comparable level of developmental age known as Attention Deficit Hyperactivity Disorder (ADHD). ADHD is considered one of the most common neurobehavioral disorders of childhood and among the most prevalent chronic health conditions. Given the wide heterogeneity and complex manifestations of the disorder, there is an importance in a developmental perspective that views ADHD as a multi-factorial disorder with multiple causal processes and pathways. The symptoms of ADHD should be cast not as static or fixed neurobehavioral deficits but rather in terms of underlying developmental processes. Even experienced professionals might minimize the prevalence of a disorder among certain groups of patients. Therefore, the existence of attention disorders might become transparent for both the patient and the professional. This might lead to a non-accurate diagnosis, harm the treatment aspects and has potential non-beneficial prognostic aspects. The developmental approach can provide predictions as to how characteristics associated with attention develop over time and how multiple risk and protective factors transact to impact its development as well as the development of a broad range of associated co-morbid features. Among children with mental retardation, autistic spectrum disorders, children who were born premature, born with low birth weight as well as among those who suffer from chronic disorders such as epilepsy, diabetes, chronic kidney disease or asthma as well as among otherwise healthy preschoolers, the assessment of attention performance might be very challenging. In this research topic, we explore the latest cutting edge research on the biological and neural pathways as well as on psychosocial and behavioral correlates of brain development and attention spectrum. In doing so, we aim to highlight what is currently known regarding this new conceptualization of attention as a spectrum, the mechanisms underlying this spectrum and where this field is headed in terms of developing our understanding of the link between brain development and attention performance.

Supravitality Hendrik Stigter, When somebody dies, various post-mortem changes take place in the body such as body cooling, post-mortem lividity and post-mortem rigidity. Methods based on these phenomena are used to estimate the post-mortem interval of a deceased human being but are inaccurate when used on their own for this purpose. Therefore, a so-called compound method is recommended in which the outcome of each method is combined for a more reliable estimation of the post-mortem interval. An additional method to estimate the post-mortem interval is based on a temporary post-mortem excitability of skeletal muscle in the early hours after death. Although known for more than a century from studies abroad in the Netherlands, this method is hardly known and applied in daily practice nor studied on a large scale. Therefore, a field study was conducted to investigate the applicability of this additional method for PMI estimation. In this

dissertation Stigter shows that there are no cogent arguments restraining this fast low cost non invasive and easy to learn method to be structurally included as an additional tool to estimate the post mortem interval as part of the compound method Using this method for estimating the post mortem interval is beneficial to post mortem investigations in individual cases further scientific research on a Dutch national level and above all serves fairer justice
