**Q1(B)**

1	Correct. Angle of deflection is proportional to $\frac{q}{m}$ . Since $m_{\text{electron}} < m_{\text{proton}}$ , electrons have a greater angle of deflection and are deflected to a larger extent than protons.
2	Correct. Electrons are attracted to the positive plate while protons are attracted to the negative plate i.e. the electron beam are deflected in the opposite direction to the proton beam.
3	Incorrect. The proton beams will travel in a curve path towards the negative plate.

**Q2(D)**

Q in the ionic nitrate,  $\text{QNO}_3$ , exists as  $\text{Q}^+$ .  
 Since  $\text{Q}^+$  has 80 electrons, Q has 81 electrons and 81 protons. From the Periodic table, Q is the element thallium which belongs to group 13.

The nucleon number of Q is  $81 + 122 = 203$ .

**Q3(C)**

A	Incorrect. $2^{\text{nd}} \text{ IE of F : } \text{F}^+ \longrightarrow \text{F}^{2+} + \text{e}^-$ $[\text{He}]2\text{s}^22\text{p}^4 \quad [\text{He}]2\text{s}^22\text{p}^3$ $3^{\text{rd}} \text{ IE of Al : } \text{Al}^{2+} \longrightarrow \text{Al}^{3+} + \text{e}^-$ $[\text{Ne}]3\text{s}^1 \quad [\text{Ne}]$ $2^{\text{nd}} \text{ IE of F is greater because the electrons are removed from an inner electronic shell.}$												
B	Incorrect <table border="1" data-bbox="183 1063 811 1206"> <thead> <tr> <th><math>3^{\text{rd}}</math> IE of</th><th>electron removed from</th></tr> </thead> <tbody> <tr> <td>F</td><td>2p</td></tr> <tr> <td>Ne</td><td>2p</td></tr> <tr> <td>Na</td><td>2p</td></tr> <tr> <td>Mg</td><td>2p</td></tr> <tr> <td>Al</td><td>3s</td></tr> </tbody> </table>	$3^{\text{rd}}$ IE of	electron removed from	F	2p	Ne	2p	Na	2p	Mg	2p	Al	3s
$3^{\text{rd}}$ IE of	electron removed from												
F	2p												
Ne	2p												
Na	2p												
Mg	2p												
Al	3s												

Correct.

C  $\text{Na}^{3+}$  and  $\text{Ne}^{3+}$  have the same electronic configuration and experience the same shielding effect.  $4^{\text{th}}$  IE of Na is greater due to the greater nuclear charge of Na which causes the 2p electrons of  $\text{Na}^{3+}$  to experience a greater effective nuclear charge and greater attraction from the nucleus, requiring more energy to remove.

Incorrect. Successive IE's always increase even if the electrons are removed from different shells.

D Successive IE's always increase as an electron is removed from a species of increasing positive charge and does not depend on which

**Q4(B)**

Since there is a large jump between the  $7^{\text{th}}$  and  $8^{\text{th}}$  IE for element W, the  $8^{\text{th}}$  electron is removed from an inner shell i.e. W has 7 valence electrons and is from group 17.

Since W, X, Y and Z are consecutive elements, X is from group 18, while elements Y and Z are from groups 1 and 2 of the next period respectively.

X, the group 18 element, has a higher first IE than W, the group 17 element of the same period since IE increases across the period.

X also has the higher first IE than Y and Z since Y and Z are from the next period and their valence electrons are further away from the nucleus.

**Sea Level Variability and Change** Ivan D. Haigh, Marta Marcos, Sönke Dangendorf, Francisco Calafat, 2017-04-27 In June 2015 we held a workshop on the beautiful island of Mallorca Spain with a focus on sea level variability and change Over 120 sea level experts from around the world attended this workshop from a range of different disciplines The main aims of the workshop were to 1 Evaluate the current state of knowledge of sea level science 2 Identify gaps and unresolved questions in any aspect of sea level science and 3 Design future research to address these issues All aspects of sea level changes were covered from global to regional observations and modelling processes driving mean sea level changes and extremes from the geological scale to the instrumental era and future projections and including impacts on the coastal zones This E Book presents papers that came out of that workshop Overall these papers illustrate the multi disciplinary nature of sea level research cross cutting many fields of research including oceanography meteorology geology coastal morphodynamics engineering and the social economic aspects Collectively these articles represent an interesting range of perspectives and original studies that contribute to understanding the dynamic nature of sea level and its impacts across a wide range of time and space scales Enjoy reading them

**Ionic Liquids: Properties and Applications** Francesca D'Anna, Jason Harper, 2019-10-17 Sustainability defined as the way to meet the needs of the present generation without compromising the ability of future ones to meet their own is one of the main challenges of modern society Within this context chemistry plays a significant role and solvent nature as well as its environmental impact are pivotal issues frequently addressed Ionic liquids i.e. organic salts that have melting temperatures lower than 100 °C have been frequently hailed as alternatives to conventional organic solvents Their greenness has been mainly ascribed to their low vapor pressure and flammability However in addition to this their high solubilizing ability and low miscibility with conventional organic solvents frequently allow for reducing the amount used as well as for their recycling Ionic liquids especially the ones featured by aromatic cations are frequently described as polymeric supramolecular fluids constructed through the establishment of feeble but cooperative supramolecular interactions like Coulomb and interactions as well as hydrogen bonds In general ionic liquids are also indicated as designer solvents as it is possible to tailor their features to specific applications by simply modifying their cation or anion structure In this way small changes in the ions structure can give rise to solvents showing very different properties The above premises widely justify the growing interest in the properties and applications of ionic liquids seen in recent literature according to Scopus more than 27 000 papers published in the last five years have ionic liquids as a keyword Thanks to their properties they have been variously used as solvent

media solvents for the obtainment of gel phases components in the building of dye sensitized solar cells media for the preparation of thermochromic materials etc This Research Topic aims to present how structural features can determine not only the properties of ionic liquids but also their possible employment In this latter case the interest arises from their ability to affect the outcome of a given reaction in terms of rate yield and nature of the products obtained for general use in the field of materials chemistry This article collection is dedicated to Prof Kenneth R Seddon for his outstanding contribution to the formation and development of the ionic liquids community

**Transfer Cells** David McCurdy, Gregorio Hueros, 2015-05-18

Transfer cells are anatomically specialized cells optimized to support high levels of nutrient transport in plants These cells trans differentiate from existing cell types by developing extensive and localized wall ingrowth labyrinths to amplify plasma membrane surface area which in turn supports high densities of membrane transporters Unsurprisingly therefore transfer cells are found at key anatomical sites for nutrient acquisition distribution and exchange Transfer cells are involved in delivery of nutrients between generations and in the development of reproductive organs and also facilitate the exchange of nutrients that characterize symbiotic associations Transfer cells occur across all taxonomic groups in higher plants and also in algae and fungi Deposition of wall ingrowth like structures are also seen in syncytia and giant cells which function as feeding sites for cyst and root knot nematodes respectively following their infection of roots Consequently the formation of highly localized wall ingrowth structures in diverse cell types appears to be an ancient anatomical adaption to facilitate enhanced rates of apoplasmic transport of nutrients in plants In some systems a role for transfer cells in the formation of an anti pathogen protective barrier at these symplastic discontinuities has been inferred Remarkably the extent of cell wall ingrowth development at a particular site can show high plasticity suggesting that transfer cell differentiation might be a dynamic process adapted to the transport requirements of each physiological condition Recent studies exploiting different experimental systems to investigate transfer cell biology have identified signaling pathways inducing transfer cell development and genes gene networks that define transfer cell identity and or are involved in building the wall ingrowth labyrinths themselves Further studies have defined the structure and composition of wall ingrowths in different systems leading in many instances to the conclusion that this process may involve previously uncharacterized mechanisms for localized wall deposition in plants Since transfer cells play important roles in plant development and productivity the latter being relevant to crop yield especially so in major agricultural species such as wheat barley soybean and maize understanding the molecular and cellular events leading to wall ingrowth deposition holds exciting promise to develop new strategies to improve plant performance a key imperative in addressing global food security This Research Topic presents a timely and comprehensive treatise on transfer cell biology to help define critical questions for future research and thereby generating a deeper understanding of these fascinating and important cells in plant biology

**Global health issues of aflatoxins in food and agriculture: Challenges and opportunities** Mehdi

Razzaghi-Abyaneh, Perng-Kuang Chang, Masoom Shams-Ghahfarokhi, Mahendra Rai, 2015-06-18 Aflatoxins are a group of polyketide mycotoxins that are produced mainly by members of the genus *Aspergillus*. Production of these toxic secondary metabolites is closely related to fungal development. Keller et al 2005, Jamali et al 2012. Contamination of food feed and agricultural commodities by aflatoxins poses enormous economic and serious health concerns because these chemicals are highly carcinogenic and can directly influence the structure of DNA. The resulting genetic defects can lead to fetal misdevelopment and miscarriages. Aflatoxins are also known to suppress immune systems. Razzaghi Abyaneh et al 2013. In a global context, aflatoxin contamination is a constant concern between the 35N and 35S latitude where developing countries are mainly situated. With expanding boundaries of developing countries, aflatoxin contamination has become a persistent problem to those emerging areas. Shams Ghahfarokhi et al 2013. The continuing threat by aflatoxin contamination of food feed and agricultural commodities to the world population has made aflatoxin research one of the most exciting and rapidly developing study areas of microbial toxins. The present research topic includes six review articles, three mini reviews, and four original research articles. Contributors highlight current global health issues arising from aflatoxins and aflatoxigenic fungi and cover important aspects of aflatoxin research including contamination of crops, epidemiology, molecular biology, and management strategies. Special attention is given to fungus-plant host interactions, biodiversity, and biocontrol. Sexual recombination in aflatoxigenic *aspergilli*, potential biomarkers for aflatoxin exposure in humans, and safe storage programs.
