D' Souza, Tulika Talukdar, 2016-09-07 Growing plants have a constitutive demand for sulfur to synthesize proteins sulfolipids and other essential sulfur containing molecules for growth and development The uptake and subsequent distribution of sulfate is regulated in response to demand and environmental cues The importance of sulfate for plant growth and vigor and hence crop yield and nutritional quality for human and animal diets has been clearly recognized The acquisition of sulfur by plants however has become an increasingly important concern for the agriculture due to the decreasing S emissions from industrial sources and the consequent limitation of inputs from atmospheric deposition Molecular characterization involving transcriptomics proteomics and metabolomics in *Arabidopsis thaliana* as well as in major crops revealed that sulfate uptake distribution and assimilation are finely regulated depending on sulfur status and demand and that these regulatory networks are integrated with cell cycle photosynthesis carbohydrate metabolism hormonal signaling uptake and assimilation of other nutrients etc to enable plant growth development and reproduction even under different biotic and abiotic stresses This knowledge can be used to underpin approaches to enhance plant growth and nutritional quality of major food crops around the world Although considerable progress has been made

regarding the central role of sulfur metabolism in plant growth development and stress response several frontiers need to be explored to reveal the mechanisms of the cross talk between sulfur metabolism and these processes In this research topic the knowledge on plant sulfur metabolism is reviewed and updated Focus is put not only on molecular mechanisms of control of sulfur metabolism but also on its integration with other vital metabolic events The topic covers 4 major areas of sulfur research sulfate uptake assimilation and metabolism regulation and role in stress response We hope that the topic will promote interaction between researchers with different expertise and thus contribute to a more integrative approach to study sulfur metabolism in plants

Application of Antigen Cross-Presentation Research into Patient Care Marianne Boes,2017-05-16 The activation of adaptive immune responses requires the processing and presentation of protein antigens to lymphocytes Especially dendritic cells are effective at display of antigen derived peptides in the form of immunogenic peptide MHC complexes to CD4 and CD8 positive T cells and can stimulate even naive T cells to clonally expand During the last 40 years mechanisms that facilitate antigen processing and presentation were clarified mostly from work in cell lines and mouse models From mouse based work it is now clear that dendritic cells represent a collection of specialized cell subsets that are particularly well endowed to stimulate antigen transport to distinct tissue locations to transfer antigens between cellular subsets or to trigger T cell responses Dendritic cell subsets hold great promise for therapeutic application for example as dendritic cell based vaccines to bolster immune responses against viruses or malignant growths Hurdles remain that preclude the efficient application of high quality pre clinical research into standardized patient care In this research topic efforts in dendritic cell research and dendritic cell based vaccines are discussed from both pre clinical and application points of view

Adult neurogenesis twenty years later: physiological function versus brain repair Paolo Peretto, Luca Bonfanti,2015-05-01 The discovery that mammalian brains contain neural stem cells which perform adult neurogenesis the production and integration of new neurons into mature neural circuits has provided a fully new vision of neural plasticity On a theoretical basis this achievement opened new perspectives for therapeutic approaches in restorative and regenerative neurology Nevertheless in spite of striking advancement concerning the molecular and cellular mechanisms which allow and regulate the neurogenic process its exploitation in mammals for brain repair strategies remains unsolved In non mammalian vertebrates adult neurogenesis also contributes to brain repair regeneration In mammals neural stem cells do respond to pathological conditions in the so called reactive neurogenesis yet without substantial regenerative outcome Why even in the presence of stem cells in the brain we lack an effective reparative outcome in terms of regenerative neurology and which factors hamper the attainment of this goal Essentially what remains unanswered is the question whether and how physiological functions of adult neurogenesis in mammals can be exploited for brain repair purposes

The Janus-Face of Language: Where Are the

Emotions in Words and the Words in Emotions? Cornelia Herbert, Thomas Ethofer, Andreas J. Fallgatter, Peter Walla, Georg Northoff, 2018-09-28 Language has long been considered independent from emotions In the last few years however research has accumulated empirical evidence against this theoretical belief of a purely cognitive based foundation of language In particular through research on emotional word processing it has been shown that processing of emotional words activates emotional brain structures elicits emotional facial expressions and modulates action tendencies of approach and avoidance probably in a similar manner as processing of non verbal emotional stimuli does In addition it has been shown that emotional content is already processed in the visual cortex in a facilitated manner which suggests that processing of emotional language content is able to circumvent in depth semantic analysis Yet this is only one side of the coin Very recent research putting words into context suggests that language may also construe emotions and that by studying word processing one can provide a window to one's own feelings All in all the empirical observations support the thesis of a close relationship between language and emotions at the level of word meaning as a specific evolutionary achievement of the human species As such this relationship seems to be different from the one between emotions and speech where emotional meaning is conveyed by nonverbal features of the voice But what does this relationship between written words and emotions theoretically imply for the processing of emotional information The present Research Topic and its related articles aim to provide answers to this question This book comprises several experimental studies investigating the brain structures and the time course of emotional word processing Included are studies examining the affective core dimensions underlying affective word processing and studies that show how these basic affective dimensions influence word processing in general as well as the interaction between words feelings and expressive behavior In addition new impetus comes from studies that on the one hand investigate how task sublexical and intrapersonal factors influence emotional word processing and on the other hand extend emotional word processing to the domains of social context and self related processing Finally future perspectives are outlined including research on emotion and language acquisition culture and multilingualism In summary this textbook offers scientists from different disciplines insight into the neurophysiological behavioral and subjective mechanisms underlying emotion and language interactions It gives new impulses to existing theories on the embodiment of language and emotion and provides new ways of looking at emotion cognition interactions
