### Introduction (1/2)

- Lanchester had discovered that all flight vehicles possess certain natural frequencies or motions when disturbed from their equilibrium flight.
- The basic flight dynamics modes of an aircraft are: the Phugoid mode, the Short-period mode, the Dutch roll mode, and the Spiral divergence mode.
- The longitudinal motion consists of two distinct oscillations: the long-period oscillation (Phugoid mode), and the short-period oscillation (Short-period mode).
- Oscillating motions can be described by two parameters: the period of time required for one complete oscillation; the time required to damp to half-amplitude or time to double the amplitude.
- The **phugoid or long-period** is the one in which there is a large-amplitude variation of airspeed, pitch and flight path angle, and altitude but almost no angle-of-attack variation.

It is really a slow interchange of kinetic energy (velocity) and potential energy (altitude) about some equilibrium energy level. Typically, the period is 20-60 seconds.

The period is so long that the pilot usually correct for this motion without being aware that the oscillation even exists.
