**Equilibrium and Kinetics in Contact Metamorphism** Gerhard Voll, Jutta Töpel, David R.M. Pattison, Friedrich Seifert, 2012-12-06 With the new global tectonics approach in the Earth Sciences the quantitative aspects of the dynamics of rock forming processes came into focus

geologists are no longer satisfied knowing the pressure temperature conditions of the formation of a metamorphic rock or of the emplacement of a magmatic body but instead would like to learn the time history of these rocks as well i.e. derive the temperature pressure time path and relate it to a tectonic process To achieve this goal a knowledge of both pressure temperature dependent equilibria and the time scales at which these equilibria may be attained are essential However the latter kinetic information is much more difficult to retrieve than that on equilibria whereas equilibria are controlled by state variables and proper laboratory experiments may be directly applied to equilibrium natural assemblages kinetics also depends on factors other than state variables such as grain size dislocation density and especially time rate of heating duration of annealing rate of cooling Extrapolation of kinetic data obtained at high temperatures on laboratory time scales to more realistic lower temperatures and geological time scales are dangerous because for example of possible changes from an intrinsically controlled defect regime to an extrinsic one as temperature is lowered or from an interface controlled to a diffusion controlled reaction mechanism
