Landscapes and Landforms of Botswana Frank D. Eckardt,2022-05-17 This volume contains 22 chapters introducing a wide range of semi arid and geologic landscapes Botswana a thinly populated nation the size of France is a Southern African keystone country at the heart of the Kalahari sharing some of the major sub continental drainage basins such as the Limpopo Zambezi Orange and Okavango with its neighbouring countries The extensive Kalahari Sand surface has been sculptured by numerous past processes which have produced subtle but regional landforms consisting of extensive dunes and shorelines Incipient rifting has created the dynamic Okavango and Makgadikgadi fan basin systems which produces iconic wetlands with a world heritage status Geological outcrops in particular to the east expose highly denuded basement lithologies which produces numerous inselbergs that are home to a rich archaeological heritage The book also examines the geomorphology of mineral and water resources which sustain the economy and population and also features dedicated chapters that cover diamondiferous kimberlites caves pans dams duricrusts and wildlife Chapter 6 is available open access under a Creative Commons Attribution 4 0 International License via link [springer.com](https://www.springer.com) *Deep Subsurface Microbiology* Andreas Teske,Jennifer F. Biddle, Virginia P. Edgcomb, Axel Schippers,2015-07-01 Deep subsurface microbiology is a highly active and rapidly advancing research field at the interface of microbiology and the geosciences it focuses on the detection identification quantification cultivation and activity measurements of bacteria archaea and eukaryotes that permeate the subsurface biosphere of deep marine sediments and the basaltic ocean and continental crust The deep subsurface biosphere abounds with uncultured only recently discovered and at best incompletely understood microbial populations In spatial extent and volume Earth s subsurface biosphere is only rivaled by the deep sea water column So far no deep subsurface sediment has been found that is entirely devoid of microbial life microbial cells and DNA remain detectable at sediment depths of more than 1 km microbial life permeates deeply buried hydrocarbon reservoirs and is also found several kilometers

down in continental crust aquifers Severe energy limitation either as electron acceptor or donor shortage and scarcity of microbially degradable organic carbon sources are among the evolutionary pressures that have shaped the genomic and physiological repertoire of the deep subsurface biosphere Its biogeochemical role as long term organic carbon repository inorganic electron and energy source and subduction recycling engine continues to be explored by current research at the interface of microbiology geochemistry and biosphere geosphere evolution This Research Topic addresses some of the central research questions about deep subsurface microbiology and biogeochemistry phylogenetic and physiological microbial diversity in the deep subsurface microbial activity and survival strategies in severely energy limited subsurface habitats microbial activity as reflected in process rates and gene expression patterns biogeographic isolation and connectivity in deep subsurface microbial communities the ecological standing of subsurface biospheres in comparison to the surface biosphere an independently flourishing biosphere or mere survivors that tolerate burial along with organic carbon compounds or a combination of both Advancing these questions on Earth s deep subsurface biosphere redefines the habitat range environmental tolerance activity and diversity of microbial life

A revised correlation of Tertiary rocks in the British Isles and adjacent areas of NW Europe C. King, 2016-01-05 This Special Report comprehensively describes the stratigraphy and correlation of the Tertiary Paleogene Neogene rocks of NW Europe and the adjacent Atlantic Ocean and is the summation of fifty years of research on Tertiary sediments by Chris King His book is essential reading for all geologists who deal with Tertiary rocks across NW Europe including those in the petroleum industry and geotechnical services as well as academic stratigraphers and palaeontologists Introductory sections on chronostratigraphy biostratigraphy and other methods of dating and correlation are followed by a regional summary of Tertiary sedimentary basins and their framework and an introduction to Tertiary igneous rocks The third and largest segment comprises the regional stratigraphic summaries Regions covered are the North Sea Basin onshore areas of southern England and the eastern English Channel area the North Atlantic margins including non marine basins in the Irish Sea and elsewhere and the Paleogene igneous rocks of Scotland

Crustal Permeability Tom Gleeson, Steve Ingebritsen, 2016-11-30 Permeability is the primary control on fluid flow in the Earth s crust and is key to a surprisingly wide range of geological processes because it controls the advection of heat and solutes and the generation of anomalous pore pressures The practical importance of permeability and the potential for large dynamic changes in permeability is highlighted by ongoing issues associated with hydraulic fracturing for hydrocarbon production fracking enhanced geothermal systems and geologic carbon sequestration Although there are thousands of research papers on crustal permeability this is the first book length treatment This book bridges the historical dichotomy between the hydrogeologic perspective of permeability as a static material property and the perspective of other Earth scientists who have long recognized permeability as a dynamic parameter that changes in response to tectonism fluid production and geochemical reactions
