

11.7 Cladogram for Tetrapods

This cladogram presents hypothesized evolutionary relationships among a group of species based on ancestry and derived characters.

CLADE

A clade is a group of organisms that share certain derived traits in common's descent. In this cladogram, a clade looks like this (area 1), including all the lineages that share traits that might wind up like 1. The cladogram also includes lineages and branches, noncoders and alligators, and birds.

NODE

In a cladogram, a node is the intersection of two branches. This node represents the most recent common ancestor shared by the entire tetrapoda clade.

DERIVED CHARACTER

Organisms that branch off after a hash mark share the derived character represented by the hash mark. An embryo protected by amniotic fluid is a derived character shared by all organisms in the amniota clade. Amphibians do not have this derived character.

Which groups of animals belong to the amniota clade? Which belong to the archosauvia clade?
