Android Security Internals Nikolay Elenkov, 2014-10-14

There are more than one billion Android devices in use today, each one a potential target. Unfortunately, many fundamental Android security features have been little more than a black box to all but the most elite security professionals until now. In Android Security Internals, top Android security expert Nikolay Elenkov takes us under the hood of the Android security system. Elenkov describes Android security architecture from the bottom up, delving into the implementation of major security-related components and subsystems like Binder, IPC, permissions, cryptographic providers, and device administration. You'll learn how Android permissions are declared, used, and enforced; how Android manages application packages and employs code signing to verify their authenticity; how Android implements the Java Cryptography Architecture (JCA) and Java Secure Socket Extension (JSSE) frameworks; about Android's credential storage system and APIs which let applications store cryptographic keys securely; about the online account management framework and how Google accounts integrate with Android; about the implementation of verified boot, disk encryption, lockscreen, and other device security features; how Android's bootloader and recovery OS are used to perform full system updates and how to obtain root access. With its unprecedented level of depth and detail, Android Security Internals is a must-have for any security-minded Android developer.

Cirella, 2013-09-24 Android mobile devices have become an attractive consumer product because of their portability high definition screens long battery life intuitive user interface and ubiquitous competitive vendor pricing The very feature that has helped with the proliferation of the devices is also one of the most problematic their portability could result in theft potentially allowing data to be compromised For applications deployed to these devices data security requirements need to be incorporated in the design process so these devices can be considered viable data collection tools Researchers at RTI have been working to secure data on Android mobile devices so that selected information on the device can be encrypted and therefore difficult to obtain illegitimately while still making confidential data easy to access We have developed software that will encrypt specific attributes of databases residing on the internal secure digital card SD card of Android devices The method we have developed could also benefit other Android applications requiring secure storage of data on globally readable and writable databases In this occasional paper we discuss
