

# Assessing Water Quality

How do population changes of aquatic invertebrates indicate water quality?

## Purpose

In this investigation you will demonstrate how water quality can be assessed by studying the effects of acid rain on different populations of aquatic invertebrates.

## Objectives :

- Investigate the effects of acid rain on different species of aquatic invertebrates.
- Describe how the presence or absence of populations of aquatic invertebrates indicates water quality.

## Procedure:

1. Click Information to read about acid rain and pH levels.
2. On the screen you will see three aquatic invertebrates in the aquarium. The pH level indicator on the aquarium shows the current pH level. Note: The specimens are not drawn to scale. The computer randomly chooses three specimens at a time from the following: aquatic earthworms, snails, tubifex worms, clams, leeches, sideswimmers, dragonfly nymphs, crayfish, fairy shrimps, and stonefly nymphs. You can click Reset until you get the selections you want to test.
3. Click the Population Bar Graph on the computer monitor to see the population data for the three species at the present pH level.
4. Click the Table button to open the Table and record the population data and the current pH level.
5. Click the pipette to dispense three drops of carbonic acid (representing acid rain) into the aquarium.
6. Click the Population Bar Graph to see the new data. Open the Table and record the population data and the current pH level.
7. Continue to add carbonic acid and record the resulting population data and pH levels until you have completed the Table.
