

## 41G Astronomy - Spectra Lab

By: \_\_\_\_\_

### Part 1: Flame Tests

### Part 2: Atomic Spectra

### Part 3: Applications of Spectra

In Part One, wooden splints dipped in solutions of metal salts are heated using a Bunsen burn producing different colored flames. By comparing the color given off by an unknown with the known metal salts, the identity of the metal salt can be determined. In Part Two, electricity is passed through the gas discharge tube resulting in different colors. When the light is passed through a diffraction grating, it is broken into components, producing a line spectrum of the element. A comparison of the line spectrum with those of known gases will allow one to determine the identity of the unknown gas. Also, you will investigate the visible light emission of "general" light sources. In Part Three, you will research various applications and/or natural occurrences of line spectra such as astronomy, aurora borealis, fireworks and neon lights.

Astrochemistry Olivia Harper Wilkins,Geoffrey A. Blake,2021-07-21 The answers to some of the most fundamental questions in science lie between the stars in molecular clouds that serve as celestial laboratories Disentangling the chemistries in extraterrestrial environments can provide clues about how planets form and shed light on problems in terrestrial chemistry that are difficult to investigate in the lab and even the origins of life Astrochemistry takes you on a tour of the molecular universe through time and space starting with the emergence of matter about 13.8 billion years ago From there the tour visits the interstellar medium with an emphasis on molecular clouds where stars are born It then goes through different evolutionary stages of stars and planets and the chemistry that emerges alongside them before ending in our own solar system where you will learn about chemical delivery by objects such as comets and meteorites
