The Cassini-Huygens Visit to Saturn Michael Meltzer, 2015-01-02 Cassini Huygens was the most ambitious and successful space journey ever launched to the outer Solar System This book examines all aspects of the journey its conception and planning the lengthy political processes needed to make it a reality the engineering and development required to build the spacecraft its 2.2 billion mile journey from Earth to the Ringed Planet and the amazing discoveries from the mission The author traces how the visions of a few brilliant scientists matured gained popularity and eventually became a reality Innovative technical leaps were necessary to assemble such a multifaceted spacecraft and reliably operate it while it orbited a planet so far from our own The Cassini Huygens spacecraft design evolved from other deep space efforts most notably the Galileo mission to Jupiter enabling the voluminous paradigm shifting scientific data collected by the spacecraft Some of these discoveries are absolute gems A small satellite that scientists once thought of as a dead piece of rock turned out to contain a warm underground sea that could conceivably harbor life And we now know that hiding under the mist of Saturn's largest moon Titan is a world with lakes fluvial channels and dunes hauntingly reminiscent of those on our own planet except that on Titan it's not water that fills those lakes but hydrocarbons These and other breakthroughs illustrate why the Cassini Huygens mission will be remembered as one of greatest voyages of discovery ever made

Verifying Greenhouse Gas Emissions National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee on Methods for Estimating Greenhouse Gas Emissions, 2010-07-28 The world's nations are moving toward agreements that will bind us together in an effort to limit future greenhouse gas emissions With such agreements will come the need for all nations to make accurate estimates of greenhouse gas emissions and to monitor

changes over time In this context the present book focuses on the greenhouse gases that result from human activities have long lifetimes in the atmosphere and thus will change global climate for decades to millennia or more and are currently included in international agreements The book devotes considerably more space to CO₂ than to the other gases because CO₂ is the largest single contributor to global climate change and is thus the focus of many mitigation efforts Only data in the public domain were considered because public access and transparency are necessary to build trust in a climate treaty The book concludes that each country could estimate fossil fuel CO₂ emissions accurately enough to support monitoring of a climate treaty However current methods are not sufficiently accurate to check these self reported estimates against independent data or to estimate other greenhouse gas emissions Strategic investments would within 5 years improve reporting of emissions by countries and yield a useful capability for independent verification of greenhouse gas emissions reported by countries
