1. What are the objectives for this experiment? (you can summarize)				
2. Make a hypothesis about how you think the two species of Paramecium will grow alone and how they will grow when they are grown together.	I think they both will grow more rapidly than together. Together they will overload the carrying capacity.			
3. Explain how you tested your hypothesis.	I ran three samples, each separate and then together, and test the growth rate every two days.			
4. On what day did the <i>Paramecium caudatum</i> population reach the carrying capacity of the environment when it was grown alone? How do you know?
