*C3 Corvette: How to Build & Modify 1968-1982* Chris Petris, 2014-02-01 The C3 Corvette's swooping fenders and unmistakable body style capture the imagination and make it an enduring classic. About a half million Corvettes were sold between 1968 and 1982 and the unique combination of Shark style handling and V 8 performance is revered. Some early C3s built between 1968 and 1974 are simply too rare and valuable to be modified, particularly the big block cars. The later Corvettes built from 1975 to 1982 came with low compression engines that produced anemic performance. The vast majority of these Corvettes are affordable, plentiful, and the ideal platform for a high performance build. Corvette expert, high performance shop owner and builder Chris Petris shows how to transform a mundane C3 into an outstanding high performance car. Stock Corvettes of this generation carry antiquated brakes, steering, suspension, and anemic V 8 engines with 165 to 220 hp. He covers the installation of top quality aftermarket suspension components, LS crate engines, big brakes, frame upgrades, and improved driveline parts. The book also includes popular upgrades to every component group, including engine, transmission, differential, suspension, steering, chassis, electrical system, interior, tires, wheels, and more. Whether you are mildly modifying your Corvette for greater comfort and driveability or substantially modifying it for vastly improved acceleration, braking, and handling, this book has insightful instruction to help you reach your goals. No other book provides as many popular how-to projects to comprehensively transform the C3 Corvette into a 21st century sports car. *Nissan/Datsun 200SX, 510, 610, 710, 810, and Maxima, 1973-84* Chilton Automotive Books, Chilton, 1997. Mesyats Pulsed Power provides in-depth coverage of the generation of pulsed electric power, electron and ion beams, and various types of pulsed electromagnetic radiation. The electric power that can be produced by the methods described ranges from 106 to 10<sup>14</sup>W for pulse durations of 10<sup>-10</sup> to 10<sup>-7</sup>s. The book consists of nine parts containing 28 chapters which deal with various aspects of pulsed power and high power electronics and cover a concise theory of electric circuits as applied to nanosecond pulse technology, physics of fast processes occurring in electrical discharges in vacuum, gases, and liquids, phenomena in long lines, mechanisms of operation, and designs of high power gas discharge plasma and semiconductor closing and opening switches, as well as of high power electric pulse generators using these switches, solid state semiconductor and magnetic methods of production and transformation of nanosecond high power pulses, and methods of production of high power pulsed electron and ion beams. The closing part describes methods applied to produce high power nanosecond pulsed X-rays, laser beams, microwaves, and ultrawideband electromagnetic radiation. This all-embracing book covers gas laser, semiconductor, and magnetic circuit elements, the phenomenon of explosive electron emission.
