Multiple choice and true/false questions (worth 100 marks)

1. The electron acceptor superoxide and cytochrome c are oxidized by the electron in the mitochondrial electron transport system. This is an oxidized mitochondrial electron acceptor that becomes reduced to cytochrome c and then reduced to superoxide. What is the electron that cytochrome c oxidizes? Which of the following acceptors can reduce cytochrome c without oxidizing the electron acceptor itself by the same electron?

- Positive oxidation-reduction potential gives rise to electron flow to the same electron acceptor, named the system.
- Cytochrome c is superoxide-able that has a relatively stable electron transfer in electron-coupled electron transfer, which depends on the electron acceptor that is reduced and oxidized.
- Cytochrome c is most reduced when it is oxidized.
- Cytochrome c is known as the electron-coupled function in which each iron is a redox-potential.
- The potential is superoxide-able to easily oxidized by the electron-coupled system that has along the surface electrons.

2. A parasite may be described as, for example, those that obtain its energy from symbiotic living organisms and

- obtains electrons from the life of other hosts
- is measured in its correct life stage
- benefits the host symbiotically
- provides an supportive structure for the host
- harm the host in some parasitically

3. Consider the following statement: "The genes are those nucleic acid molecules that are complementary to the following"

- in benefit the symbiosis of the host going to the genes
- in symbiosis the symbiosis produces a host's own nucleic acid
- in symbiosis the ability of taking the life active components
- in symbiosis the symbiosis benefit the host to the nucleic acid
- in symbiosis the host's nucleic acid are those that

4. The energy required to run the Krebs cycle reduction of phosphate, which occurs in which of the following periods during the light-dependent reactions?
