A Face Recognition Application Based on OpenCV and Android Shaomin Zhang,2015

Real-time Face Detection Using Java Programming Language on Embedded Systems Seyed-Kayhan Hashemi,2012 In the past half century growth of computer systems has made mankind s life much easier than before This growth in technology of computer systems improved our lifestyle in different criteria and developed our knowledge even faster than before Quality management of products in mega factories to micro computers which are used in medical technologies to make surgery process faster and more accurate are just a few instances of this improvements Embedded system is one of the usages of this new innovated technology for the past decades An embedded system is a system that has everything which a computer needs to run like processor and memory and IO Input and Output but in a very small scale Though the point of Embedded system is that it can run in unstable conditions for example in hot weather or under water or places that have enormous shakes or etc On the other hand one of the areas which has been very popular in computer field is photography and image processing Different types of computers can be used based on our requirements to do jobs like noise reduction pattern recognition obtaining 3D pictures and in lots of other fascinating domains Face detection a kind of pattern detection is a pre requirement of face recognition that has

enormous usage these days This field has also been considered as one of the most popular research areas since annually more than a thousand of titles published in main engineering and scientific journals are allocated to this area academic databases journals such as Academic Search Premier IEEE Explore SCOPUS and other important databases contain several research works in the field of face detection The two main important issues in face detection processing are time consumption optimization with the intention of reaching highest speed possible while maintaining the second aspect which is an acceptable accuracy of the detection results Thus C and or C are employed to do the detection process as fast as possible mainly because they are of good programming languages that are considered close to low level languages in spite the fact that they are high level programming languages Other high level programming languages have not been used in this area due to the fact that they have more latency for execution compared to these two languages One of these popular high level programming languages is Java Java is an object oriented programming language and it has lots of open source libraries that implements different classes for different purposes which can be used by programmers But the main thing that has made Java programming language the most popular one for software developers is that it is platform independent For languages like C or C the source code should be compiled for each platform separately consequently the outputs of programs are not guaranteed to be the same for them as well However as programs written in Java run on a virtual machine and this virtual machine itself runs on top of operating systems outputs of the programs are guaranteed to be the same for all of these operating systems Actually the only thing that should be provided is an interpreter which is the JVM Java Virtual Machine installed on top of the OS Operating System According to Barr Frank 1 this virtual machine as an interpreter causes at least ten percent of latency to provide outputs for a program which is written in java compared to the same program that is written in C and or C From embedded system point of view it is also an issue as there is no software for JVM provided in this area Fortunately few processors have been developed recently which are able to execute java programs directly on the processor with no need of an interpreter These processors implement JVM in hardware which are mostly soft cores regards to research purpose and sometimes hardcore architecture instead of a JVM application As a result it is expected that the mentioned extra latency which is caused by virtual machine interpreter is avoided for an embedded system that runs java programs through usage of hardware implemented JVMs The aim of this research is to run a face detection application which is implemented by java on a hardware implementation of Java Virtual Machine JVM in an embedded system and compare it with the PC Personal Computer version of the same program Moreover problems that might occur in whole process will be inspected and analyzed Finally the result will be compared with a couple of other face detectors which was previously proposed by Sim and Yan as their Master of Engineering Thesis First chapter gives a brief introduction towards the whole idea of research A quick history of face detection systems is provided in this chapter and the outline of the thesis is explained as well The second chapter brings an insight over current algorithms of face detection and it is followed by an explanation on

the algorithm which has been used in this research in full details Then in third chapter we will talk about Java programming language and Java Virtual Machine and its implementations especially hardware implementation After all in this chapter JOP Java Optimized Processor will be reviewed as a hardware implementation of JVM the manner by which it has been used in this research The forth chapter explains the face detection application which is implemented in Java by one of the open source libraries In the fifth chapter the very same program will be mapped to the JOP and implemented by DE2 115 FPGA board Eventually I will bring future works and possible improvement for the research in the last chapter

Face Recognition for Real Time Application Pradeep Kakkar, 2017-11-27 Master s Thesis from the year 2017 in the subject Engineering Computer Engineering grade 10 course M Tech ECE language English abstract Images containing faces are essential to intelligent vision based human computer interaction and research efforts in face processing include face recognition face tracking pose estimation and expression recognition The rapidly expanding research in face processing is based on the premise that information about a user s identity state and intent can be extracted from images and that computers can then react accordingly e g by knowing person s identity person may be authenticated to utilize a particular service or not A first step of any face processing system is registering the locations in images where faces are present The local binary pattern is a simple yet very efficient texture operator which labels the pixels of an image by thresholding the neighborhood of each pixel and considers the result as a binary number The LBP method can be seen as a unifying approach to the traditionally divergent statistical and structural models of texture analysis Perhaps the most important property of the LBP operator in real world applications is its invariance against monotonic gray level changes caused e g by illumination variations Another equally important is its computational simplicity which makes it possible to analyze images in challenging real time settings The success of LBP in face description is due to the discriminative power and computational simplicity of the LBP operator and the robustness of LBP to mono tonic gray scale changes caused by for example illumination variations The use of histograms as features also makes the LBP approach robust to face misalignment and pose variations For these reasons the LBP methodology has already attained an established position in face analysis research Because finding an efficient spatiotemporal representation for face analysis from videos is challenging most of the existing works limit the scope of the problem by discarding the facial dynamics and only considering the structure Motivated by the psychophysical findings which indicate that facial movements can provide valuable information to face analysis spatiotemporal LBP approaches for face facial expression and gender recognition from videos were described
