Multivariate Calculus with Linear Algebra Philip Chadsey Curtis, 1972 **Introduction to Calculus and Classical Analysis** Omar Hijab, 2007-04-17

This is the second edition of an undergraduate one variable analysis text. Apart from correcting errors and rewriting several sections material has been added notably in Chapter 1 and Chapter 4. A noteworthy addition is a re variable computation of the radius of convergence of the Bernoulli series using the root test Chapter 5. What follows is the preface from the first edition. For undergraduate students the transition from calculus to analysis is often disorienting and mysterious. What happened to the beautiful calculus formulas? Where did and open sets come from? It is not until later that one integrates these seemingly distinct points of view. When teaching advanced calculus I always had a difficult time answering these questions. Now every mathematician knows that analysis is naturally in the nineteenth century out of the calculus of the previous two centuries. Believing that it was possible to write a book reflecting explicitly this organic growth I set out to do so. I chose several of the jewels of classical eighteenth and nineteenth century analysis and inserted them at the end of the book inserted the axioms for reals at the beginning and filled in the middle with and only with the material necessary for clarity and logical completeness. In the process every little piece of one variable calculus assumed its proper place and theory and application were interwoven throughout.

Differential Geometry and Homogeneous Spaces
Kai Köhler, 2024-10-29 This textbook offers a rigorous introduction to the foundations of Riemannian Geometry with a detailed treatment of homogeneous and symmetric spaces as well as the foundations of the General Theory of Relativity. Starting with the basics of manifolds it presents key objects of differential geometry such as Lie groups, vector bundles and de Rham cohomology with full mathematical details. Next the fundamental concepts of Riemannian geometry are introduced paving the way for the study of homogeneous and symmetric spaces. As an early application a version of the Poincaré-Hopf and Chern-Gauss-Bonnet Theorems is derived. The final chapter provides an axiomatic deduction of the fundamental equations of the General Theory of Relativity as another important application. Throughout the theory is illustrated with color figures to promote intuitive understanding and over 200 exercises are provided many with solutions to help master the material. The book is designed to cover a two semester graduate course for students in mathematics or theoretical physics and can also be used for advanced undergraduate courses. It assumes a solid understanding of multivariable calculus and linear algebra.
