BAR MAGNET

Iron filings on glass
bar magnet
poles -南北

→ Poles are due to the charge of electric dipole

→ Poles - North pole (+) & South pole (-)

for suspension, poles point towards geographic north & south pole

like poles - repel

unlike poles - attract

poles never separated - monopole n't exist

MAGNETIC FIELD LINES

Imaginary curve. Length is any power of direction of magnetic field at that point

MFL of bar magnet

Conductor carrying

current I, close loop

around it

Electric field lines - open

loop ends at

Surface magnet - Field lines direction

inside - S → N

→ Field lines never intersect each other.

→ At point of intersection, 2 magnetic

poles

thus medium 2 directions of magnetic

field at same point

which is not possible

12th Physics Key Notes:

Mathematical Methods Oscillations Waves , The Physics of Music and Color Leon Gunther,2019-10-14 This undergraduate textbook aids readers in studying music and color which involve nearly the entire gamut of the fundamental laws of classical as well as atomic physics The objective bases for these two subjects are respectively sound and light Their corresponding underlying physical principles overlap greatly Both music and color are manifestations of wave phenomena As a result commonalities exist as to the production transmission and detection of sound and light Whereas traditional introductory physics textbooks are styled so that the basic principles are introduced first and are then applied this book is based on a motivational approach It introduces a subject with a set of related phenomena challenging readers by calling for a physical basis for what is observed A novel topic in the first edition and this second edition is a non mathematical study of electric and magnetic fields and how they provide the basis for the propagation of electromagnetic waves of light in particular The book provides details for the calculation of color coordinates and luminosity from the spectral intensity of a beam of light as well as the relationship between these coordinates and the color coordinates of a color monitor The second edition contains corrections to the first edition the addition of more than ten new topics new color figures as well as more than forty new sample problems and end of chapter problems The most notable additional topics are the identification of two distinct spectral intensities and how they are related beats in the sound from a Tibetan bell AM and FM radio the spectrogram the short time Fourier transform and its relation to the perception of a changing pitch a detailed analysis of the transmittance of polarized light by a Polaroid sheet brightness and luminosity and the mysterious behavior of the photon The Physics of Music and Color is written at a level suitable for college students without any scientific background requiring only simple algebra and a passing familiarity with trigonometry The numerous problems at the end of each chapter help the reader to fully grasp the subject
