## 2014 Exam Laper Licks:

Zizek: Paper Revolutionary Marko Zlomislíć, 2018-05-18 In this new book Marko Zlomislíć argues that Slavoj Žižek's work does not contain any sort of radical emancipatory project especially as it passes through the ideology of communism and Lacanian psychoanalysis The evidence for the failure of communism is vast and includes the more than six hundred mass graves recently located in Žižek's homeland of Slovenia Zlomislíć demonstrates that the way out of the capitalist dilemma is not a repetition of communism but a return to the late medieval notion of haecceity or individual thisness that was rejected by modernity Haecceity or the indescribable and indefinite here and now of the person shows that the late medieval Franciscans were already postmodernists It is no wonder that the totalitarianism of the modernist Hegel is embraced by thinkers such as Žižek Badiou Hardt Negri and Laclau and was already rejected by Leibniz Kierkegaard Nietzsche Levinas Deleuze and Derrida This important book shows that Žižek's work must be rejected because it does not uphold the dignity worth and uniqueness of the person *Neuropharmacological, Neurobiological and Behavioral Mechanisms of Learning and Memory* Alfredo

**Animal-friendly methods for rodent behavioral testing in neuroscience research** Raffaele d'Isa, Stefania Fasano, Riccardo Brambilla, 2024-07-03 Rodent behavioral testing has been used to study brain functions since the 1890s and has become a gold standard model in modern neuroscience Up to the 1950s most behavioral tests on laboratory rodent models were based on punishments and rewards Both approaches can lead to a certain degree of animal pain or suffering Punishments involved the employment of painful stimuli typically electric shocks Passive avoidance and fear conditioning tests among the most widely used behavioral paradigms used to evaluate learning and memory in rodents can be performed using only a single brief shock Other tests such as the active avoidance might require up to tens or hundreds of shocks strongly challenging the psychological welfare of the model animals On the other hand tests based on rewards which apparently may seem more ethical actually still induce suffering in the animals as food rewards are almost always associated with a food restriction protocol in order to motivate food seeking behavior Rodents are starved for days before starting the test and kept under food restriction for the whole duration of the test The distress during the testing session is only a minimal part compared to the stress lived outside of the testing session which is prolonged and continuous Analogously liquid rewards commonly rely on a previous water restriction protocol to use thirst as motivation Animal stress is not only an ethical issue per se but also an important factor potentially impacting on the reliability and reproducibility of experimental results
