Geometry
Segments, Rays & Lines

Some Thoughts About ...

Line Segments

- Line segments are generally named by their endpoints, so the segment at right could be named either $\overline{AB}$ or $\overline{BA}$.

- Segment $\overline{AB}$ contains the two endpoints (A and B) and all points on line $\overleftrightarrow{AB}$ that are between them.
Rays

- Rays are generally named by their single endpoint, called an **initial point**, and another point on the ray.

- Ray $\overrightarrow{AB}$ contains its initial point A and all points on line $\overleftrightarrow{AB}$ in the direction of the arrow.

- Rays $\overrightarrow{AB}$ and $\overrightarrow{BA}$ are not the same ray.

- If point O is on line $\overleftrightarrow{AB}$ and is between points A and B, then rays $\overrightarrow{OA}$ and $\overrightarrow{OB}$ are called **opposite rays**. They have only point O in common, and together they make up line $\overleftrightarrow{AB}$.

Lines

- Lines are generally named by either a single script letter (e.g., ℓ) or by two points on the line (e.g., $\overleftrightarrow{AB}$).

- A line extends infinitely in the directions shown by its arrows.

- Lines are **parallel** if they are in the same plane and they never intersect. Lines f and g, at right, are parallel.

- Lines are **perpendicular** if they intersect at a 90° angle. A pair of perpendicular lines is always in the same plane. Lines f and e, at right, are perpendicular. Lines g and e are also perpendicular.

- Lines are **skew** if they are not in the same plane and they never intersect. Lines k and ℓ, at right, are skew. (Remember this figure is 3-dimensional.)
