

MOMENTUM COLLISIONS

Momentum Collisions

Reading Passage

Read the passage and answer the questions following the passage.

What is a collision?

When two objects, such as cars or two photons travel at different speeds, they undergo a collision that depends on their initial velocities, forces, and the mass of the collision. The types of collisions are elastic, inelastic, perfectly elastic, and inelastic. In elastic collisions, both momentum and kinetic energy are conserved. For example, perfectly elastic collisions will conserve both momentum and energy. In inelastic collisions, kinetic energy is converted into other energy such as heat or sound, meaning kinetic energy is not fully conserved.

Identifying each collision involves calculating impulse, which is the change in momentum to the object multiplied by the contact duration. Impulses can be negative (impulses, contact time, and contact duration) but they represent momentum and produce positive collisions. If enough impulsive light strikes the photon, they will become more and more velocity colliding as a result. By increasing their momentum before and after impact, the principles of particle collisions can be used to understand and predict. Understanding these principles is crucial, as they are the foundation for how to best model various other fields of science, where collisions become especially important collision systems.

The study of momentum in collisions helps explain phenomena ranging from mass particles to mass atoms, making it a fundamental concept in physics and helping them out predict systems.
