

CURRENT ELECTRICITY

Introduction

Current electricity is the study of flow of charge through a conductor.

- A charge particle which flow can be positive or negative.
- A push called voltage is needed to enable the charge to flow. The charge move from high electric potential to low electric potential.
- For an electric current to flow, two things are necessary, a source and a closed path.

POTENTIAL DIFFERENCE AND ELECTROMOTIVE FORCE

Electric potential difference (pd) – is the work done per unit charge in moving electric charge from one point to another.

$$\text{potential difference} = \frac{\text{work done (W)}}{\text{charge moved (Q)}}$$

- The SI unit for Pd is **Volt**. One volt is equivalent to one joule per coulomb.
- Potential difference is measured by **Voltmeter**.
- The electromotive force Emf of a cell is potential difference across the terminal when there is no current flowing through it.
- Emf is not a force but a process whereby a device such as cell or generator convert chemical or mechanical energy into electrical energy.
- It can be thought of as an electrical potential energy that is converted into the kinetic energy of charge moving in on electric circuit.

Thus the cell provides an electromotive force which sets up (Pd) across various circuit components, there by driving current through them.

When a cell is connected to an external device such as lamp, electric current flow through the device and some electric energy is converted into other form like heat and light.

- The amount of converted energy per unit charge is the potential difference Pd across the device. The potential difference is also called a **voltage**.
- When several cells have been joined together they form a **battery**. This voltage cause the flow of charge (electron).
- Every cell has a voltage across the terminal. This voltage causes the flow of charge (electron) in a circuit. A dry cell has a voltage 1.5 V normally marked on a cell.
- Voltage is measured by using a voltmeter, and the SI unit of a voltage is VOLT (V).
- If 1 coulomb of charge given 1 Joule of potential difference energy, then the Pd across terminal of a battery is 1 volt.
