

Algebra Chapter 4

Linear equations and matrices

Solution of linear equations

We all know how to solve two linear equations in two unknowns, such as, for example,

$$\begin{aligned}2x + 3y &= 3 \\3x + 4y &= 5.\end{aligned}$$

The aim is to eliminate x from one equation and y from the other, so that we end up with the solution

$$\begin{aligned}x &= 3 \\y &= -1.\end{aligned}$$

Note that the solution can be thought of as two other equations, namely

$$\begin{aligned}1x + 0y &= 3 \\0x + 1y &= -1.\end{aligned}$$

These solution equations are of a particularly simple form, in that each equation has one coefficient equal to 1 and the other coefficient(s) equal to 0. The process usually called eliminating a variable can be looked at as changing the coefficient of that variable to zero, and the general solution process can be regarded as modifying the coefficients of the given equations in such a way that we end up with new equations, in each of which one coefficient is 1 and all other coefficients are 0.

In this solution process the following operations are used:

- (1) multiply an equation through by a non-zero constant,
- (2) add or subtract a multiple of one equation to or from another one.

These operations are legitimate, provided they are applied to both sides of the equations, since they simply represent the facts:

Approximation by Algebraic Numbers Yann Bugeaud, 2004-11-08 Algebraic numbers can approximate and classify any real number. Here the author gathers together results about such approximations and classifications. Written for a broad audience the book is accessible and self-contained with complete and detailed proofs. Starting from continued fractions and Khintchine's theorem Bugeaud introduces a variety of techniques ranging from explicit constructions to metric number theory including the theory of Hausdorff dimension. So armed the reader is led to such celebrated advanced results as the proof of Mahler's conjecture on S numbers the Jarník-Besicovitch theorem and the existence of T numbers. Brief consideration is given both to the p-adic and the formal power series cases. Thus the book can be used for graduate courses on Diophantine approximation some 40 exercises are supplied or as an introduction for non-experts. Specialists will appreciate the collection of over 50 open problems and the rich and comprehensive list of more than 600 references Algebra for Schools and Colleges Simon Newcomb, 1884 **Algebra for Beginners** Henry Sinclair Hall, Samuel Ratcliffe Knight, 1895 **Algebra for Beginners** William Frothingham Bradbury, Grenville C.
