## Gas Laws and Stoichiometry

### 3 Scenarios:

1. If the P and T in an all gas system remain constant and the problem is one of volume going to volume...
  - **Gay-Lussac's Law** – If the T and P in an all gas system remain constant, the **volumes** of reacting gases are directly related to the **coefficients** of the balanced system.

- Eliminates having to find moles in the problem, thus...
- Eliminates having to use molar volume or  $PV = nRT$  in the problem

*Example: What volume of hydrogen gas would combine with 42 L. of oxygen gas to form steam at a constant 750 °C and atmospheric pressure?*

2. If conditions are at STP but there are grams involved...
  - **Molar Volume** – Convert the grams to moles, use the balanced equation, and then use molar volume to find the volume of gas produced.

*Example: Calculate the liters of CO<sub>2</sub> measured at 0°C and 1 atm that could be obtained by allowing 45.0 g of calcium carbonate to react with an excess of hydrochloric acid (The molar mass of calcium carbonate is 100. g/mol).*
