[Concern-oriented and Model-driven Migration of Legacy Java Applications to RESTful Web Services](#) Bo Wen Li,2022 With modern advances in internet technologies many existing native software systems have been extended to web services to enable the querying and modification of data from anywhere in the globe across the network REpresentational State Transfer REST proposes a standard architectural style for web services and defines a collection of constraints for their behaviour Nowadays developers can integrate the REST interface in their software system by incorporating an appropriate framework that implements REST Popular REST implementation technologies include Spring Boot Eclipse Jersey JBoss RESTEasy and Apache CXF There is significant technical complexity in the development process of RESTful web services The typical web service development first involves designing a REST resource tree consisting of Uniform Resource Identifiers URIs and HTTP request methods for the designated controller operations Next a compatible REST framework is selected to be integrated as a dependency to the existing software system Now in order to accommodate for the requirements of the selected REST technology the existing build pipeline is updated and new source code files are implemented correspondingly to the specification of the new dependency Finally the designated controller classes operations and applicable parameters are decorated with the defined REST annotations from the framework technology In this thesis we propose an alternative approach to building REST applications based on Model Driven Engineering MDE Domain Specific Modelling Languages DSMLs and Concern Oriented Reuse CORE We encapsulate the technical complexity of REST frameworks in a reusable unit called the RESTify concern With the RESTify concern the interface to the existing software system is represented at a high level of abstraction with a Reusable Aspect Model RAM composed of a UML Class Diagram design model The design of the REST Resource tree is accomplished with a domain specific Resource Tree Language ResTL The connection between the REST interface and the application functionality is done by providing mappings from ResTL to RAM avoiding the tedious placement of REST Java annotations across multiple Java files Finally a functional and ready to deploy RESTful web service can be generated from the models simply by selecting the concrete REST implementation framework to use To implement the RESTify pipeline this thesis delivers several contributions 1 an extension of the CORE metamodel to support reuse and selection of features of the RESTify concern 2 a graphical user editor for the ResTL language as well as a 3 a split view

capable of displaying ResTL and RAM design models simultaneously and establish coherent mappings between them 4 a refactoring and modularization of the previously monolithic code generation transformations in order to maximize transformation reuse among the different REST implementations and finally 5 an algorithm for composing Maven build configuration files
