Commerce, Justice, Science, and Related Agencies,2011 **Probing auditory scene analysis** Elyse S Sussman,Susan Denham,Susann Deike,2015-02-11 In natural environments the auditory system is typically confronted with a mixture of sounds originating from different sound sources As sounds spread over time the auditory system has to continuously decompose competing sounds into distinct meaningful auditory objects or auditory streams referring to certain sound sources This decomposition work which was termed by Albert Bregman as Auditory scene analysis ASA involves two kinds of grouping to be done Grouping based on simultaneous cues such as harmonicity and on sequential cues such as similarity in acoustic features over time Understanding how the brain solves these tasks is a fundamental challenge facing auditory scientist In recent years the topic of ASA was broadly investigated in different fields of auditory research including a wide range of methods studies in different species and modeling Despite the advance in understanding ASA it still proves to be a major challenge for auditory research This includes verifying whether experimental findings are transferable to more realistic auditory scenes A central approach in understanding ASA is the use of certain stimulus parameters that produce an ambiguous percept The advantage of such an approach is that different perceptual organizations can be studied without varying physical stimulus parameters Additionally the perception of ambiguous stimuli can be volitionally controlled by intention or task By using this one can mirror real hearing situations where listeners intent to identify and to localize auditory sources Recently it was also found that in classical auditory streaming sequences perceptual ambiguity was not restricted to but was observed over a broad range of stimulus parameters The proposed Research Topic pursues to bring together scientist in the different fields of auditory research whose work addresses the issue of perceptual ambiguity Researchers were welcome to contribute experimental reports computational modeling and reviews that consider auditory ambiguity in its modality specific characteristics as well as in comparison to visual ambiguous figures The overall goal of contributions was to consider the experimental findings from the perspective of real auditory scenes In a broader sense the Research Topic was open for contributions which are related to the issue of active listening in complex scenes [Yale Law Journal: Volume 124, Number 4 - January-February 2015](#) Yale Law Journal,2015-02-04 The contents of the January February 2015 issue of the Yale Law Journal Volume 124 Number 4 are Articles Cost Benefit Analysis of Financial Regulation Case Studies and Implications John C Coates IV Beyond the Indian Commerce Clause Gregory Ablavsky Essays On Evidence

How Humans

Recognize Objects: Segmentation, Categorization and Individual Identification Chris Fields, 2016-08-18 Human beings experience a world of objects bounded entities that occupy space and persist through time. Our actions are directed toward objects and our language describes objects. We categorize objects into kinds that have different typical properties and behaviors. We regard some kinds of objects each other for example as animate agents capable of independent experience and action while we regard other kinds of objects as inert. We re-identify objects immediately and without conscious deliberation after days or even years of non-observation and often following changes in the features locations or contexts of the objects being re-identified. Comparative developmental and adult observations using a variety of approaches and methods have yielded a detailed understanding of object detection and recognition by the visual system and an advancing understanding of haptic and auditory information processing. Many fundamental questions however remain unanswered. What for example physically constitutes an object? How do specific classically characterizable object boundaries emerge from the physical dynamics described by quantum theory and can this emergence process be described independently of any assumptions regarding the perceptual capabilities of observers? How are visual motion and feature information combined to create object information? How are the object trajectories that indicate persistence to human observers implemented and how are these trajectory representations bound to feature representations? How for example are point light walkers recognized as single objects? How are conflicts between trajectory driven and feature driven identifications of objects resolved for example in multiple object tracking situations? Are there separate what and where processing streams for haptic and auditory perception? Are there haptic and or auditory equivalents of the visual object file? Are there equivalents of the visual object token? How are object identification conflicts between different perceptual systems resolved? Is the common assumption that persistent object is a fundamental innate category justified? How does the ability to identify and categorize objects relate to the ability to name and describe them using language? How are features that an individual object had in the past but does not have currently

represented How are categorical constraints on how objects move or act represented and how do such constraints influence categorization and the re identification of individuals How do human beings re identify objects including each other as persistent individuals across changes in location context and features even after gaps in observation lasting months or years How do human capabilities for object categorization and re identification over time relate to those of other species and how do human infants develop these capabilities What can modeling approaches such as cognitive robotics tell us about the answers to these questions Primary research reports reviews and hypothesis and theory papers addressing questions relevant to the understanding of perceptual object segmentation categorization and individual identification at any scale and from any experimental or modeling perspective are solicited for this Research Topic Papers that review particular sets of issues from multiple disciplinary perspectives or that advance integrative hypotheses or models that take data from multiple experimental approaches into account are especially encouraged
