

An extensive test program led to the development and certification of an optional kit for the 737, including deflation valves on the main and nosewheel legs, an inflation restraint blanket on the underside of the aircraft, protection on the inflator legs and for the hydraulic brake line and the speed brake control valve, strengthening of the VIB, 7300 and ATC controls on the underside of the fuselage and various adaptations of "flow-through" flow-through engine starters. The difference in the forward-sloping nose wheel is of such design that it cannot be lowered to the ground when full and a

deflation valve is located in the main fuselage area. As the 737, Boeing offered an executive model of the jet early in its development, suggesting various spacious layouts for about 30 passengers. With optional seats that, range of up to 8,000 sq ft of floor area could be achieved. Some of the 737 is an executive site have included the East Corporation and some foreign governments, including those of Egypt, Niger and Venezuela. NASA, which acquired the original company-owned 737-200 in 1975, had its aircraft specially modified to incorporate a second cockpit in the main

passenger cabin, with which the pilot could be separated through forward guidance and control system, while the flight was monitored by check pilots on the flight deck.

# History in brief

Boeing took the decision to launch its third jet transport after the 707 and 720 in November 1964, although the formal commitment to put the new type into production had to wait until later when orders were forthcoming. In the event, the point was reached on 15 February 1967 when the German airline Lufthansa announced a contract for 25 Boeing 737s at a price, including spares, of about £2M (the £1.5M contract). The launch decision came after a period of intensive design

**Advancements in Electric Machines** J. F. Gieras, 2008-11-14 Traditionally electrical machines are classified into d c commutator brushed machines induction asynchronous machines and synchronous machines These three types of electrical machines are still regarded in many academic curricula as fundamental types despite that d c brushed machines except small machines have been gradually abandoned and PM brushless machines PMBM and switched reluctance machines SRM have been in mass production and use for at least two decades Recently new topologies of high torque density motors high speed motors integrated motor drives and special motors have been developed Progress in electric machines technology is stimulated by new materials new areas of applications impact of power electronics need for energy saving and new technological challenges The development of electric machines in the next few years will mostly be stimulated by computer hardware residential and public applications and transportation systems land sea and air At many Universities teaching and research strategy oriented towards electrical machinery is not up to date and has not been changed in some countries almost since the end of the WWII In spite of many excellent academic research

achievements the academia industry collaboration and technology transfer are underestimated or quite often neglected Underestimation of the role of industry unfamiliarity with new trends and restraint from technology transfer results with time in lack of external nancial support and drastic cline in the number of students interested in Power Electrical Engineering
