

## Chapter 5 -- Elasticity and Its Application

In this chapter, look for the answers to these questions:

- What is elasticity? What kinds of factors can elasticity help us understand?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's responsiveness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

It interests...

How things respond to some phenomena.

How change in price affects quantity, and vice versa, and how quantity can change.

How price is related to the opportunity cost of your time, to your thinking, to your good or bad.

How the elasticity of demand tells you how much you will be able to produce if you have your price. How much more produce? How much will your demand fall if you have a price increase?

Examples:

- Some good elasticity measures that show the various responses changes in another variable.
  - One type of elasticity measures how much demand for other variables will fall if one variable goes up.
- Definition: The change in a variable's measure of the responsiveness of  $Q^D$  to  $Q^S$  to a change in the independent variable.

Price Elasticity of Demand

- Price elasticity of demand measures how much  $Q^D$  responds to a change in  $P$ .
- Formula: the price elasticity of demand's demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Using a demand, P and Q move in opposite directions, which means that price elasticity is negative. Use the formula and multiply sign and then the absolute sign, and report without direction in positive numbers.

Example:

The price elasticity of demand is -0.5. This means that a 1% change in price will result in a 0.5% change in quantity demanded.

Calculating Percentage Changes

Example: P falls 50%, Q falls 10%  
 elasticity =  $(-10\% / 50\%) = -0.2$

Example: P falls 50%, Q falls 5%  
 elasticity =  $(-5\% / 50\%) = -0.1$
